Ukraine Attacks Involved Exploitation of Log4j, October CMS Vulnerabilities

By [Eduard Kovacs](#) on January 19, 2022

CISA Warns Organizations of 'Critical Threats' Following Ukraine Attacks

The U.S. Cybersecurity and Infrastructure Security Agency (CISA) has warned organizations about “potential critical threats” following the recent cyberattacks aimed at Ukraine.

In a two-page “insights” document published on Tuesday, [CISA advised all organizations](#) — regardless of their size or sector — to immediately implement steps to reduce the likelihood of damaging breaches, quickly detect intrusions, ensure that they are prepared to respond to an intrusion, and improve their resilience to destructive attacks.

“This CISA Insights is intended to ensure that senior leaders at every organization in the United States are aware of critical cyber risks and take urgent, near-term steps to reduce the likelihood and impact of a potentially damaging compromise,” CISA said.

Tens of Ukrainian government websites were [hacked](#) last week, being defaced with messages suggesting the attack was in response to the country’s pro-Western stance. A majority of the sites have since been restored.

[Russia has been blamed](#) for the attack, but the Kremlin has denied the accusations, with the presidency claiming that “Russia has nothing to do with these cyberattacks.”

Microsoft said the operation involved a new and destructive piece of malware that the tech giant tracks as [WhisperGate](#). The malware has been described as a master boot record wiper disguised as ransomware —

WhisperGate appears to be ransomware, but it lacks a recovery mechanism for when victims pay the ransom.

An analysis of the malware conducted by Symantec showed that samples related to WhisperGate may have been [deployed to unknown victims](#) as early as October 2021.

The attackers breached Ukrainian government networks through a supply chain attack involving a third-party software supplier named Kitsoft, which has [confirmed](#) that its infrastructure had been compromised.

Ukrainian cybersecurity agencies said [the attack involved](#) exploitation of CVE-2021-32648, a vulnerability in the October CMS, as well as exploitation of the notorious [Log4Shell](#) flaw, and DDoS attacks.

The October CMS flaw allows attackers to gain access to accounts after resetting their password.

The October CMS vulnerability was added by CISA on Tuesday to its [Known Exploited Vulnerabilities Catalog](#). Security holes added to this list must be patched by federal agencies within two weeks.

CISA's warning comes just days after several U.S. government agencies issued a joint advisory to provide an overview of [cyber operations linked to Russia](#). The advisory was published as tensions mount over a potential Russian invasion of Ukraine.

On one hand, the recent attacks aimed at Ukraine [add to tensions](#). On the other hand, Russia for the first time announced that it has arrested alleged members of a notorious ransomware gang [at the request of the United States](#).
